Static IP	IP	Please input the IP Address
	Gateway	Please input the Gateway Address

Call settings

You may set the call answer mode for the WiFi phone.

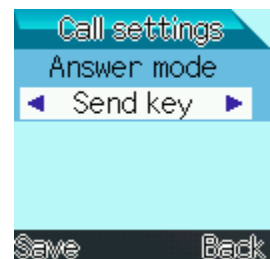

1. **Stand-by screen** > **Menu** > **Settings** > **Call settings**

2. Press the navigation key  or  to browse to "Answer mode".

3. Press the navigation key  or  to switch to the answer mode you need.

- Select "Send key", then you may press  to answer the call.
- Select "Any key", then you may press any key to answer the call.
- Select "Auto answer", then the incoming call will be answered automatically after few seconds.

4. Press  (Left · Save) to save this call setting.

Call divert

Call divert can divert your incoming call to other phone, this service usually needs the telecommunication carrier to support. And your telecommunication carrier will provide you the related setting mode.

1. **Stand-by screen > Menu > Settings > Call divert**

2. Press the navigation key  or  and select the conditions for the call to divert.

- Unconditional: All the incoming call will be diverted to the specified phone number.
- Busy: When the phone is busy, the incoming call will be diverted to the specified number.
- No reply: If the incoming call is not answered in the time you set, the call will be diverted to specified phone number.

3. Press  (left · Save) to save this call divert setting.

Security

If the phone password is activated, then you will have to input the phone password after turning on the WiFi phone. If the password is confirmative, the phone will be started. The phone password confirmation function may prevent you from phone misuse.

Do not use the emergency phone number to be the phone password, in order to avoid confusion with the emergency phone number.

If you forget the phone password, please contact your telecom carrier for help.

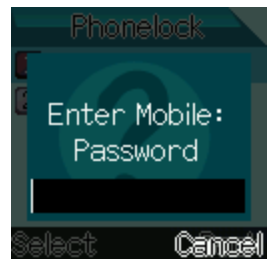

Activate and deactivated the WiFi phone password.

1. **Stand-by screen > Menu > Settings > Security > Phonelock**

2. Press the navigation key  or  and browse to

- Activated : to enable the phone password confirmation
- Deactivate : to disable the phone password confirmation

3. Press  (left · Select), and you will be asked to input the phone

password, the phone password setting will only be enabled or unlocked after confirmation.

Change WiFi phone password.

The WiFi phone factory password is 1234, please change the password the first time you use the phone, to prevent your password from being compromised and this safety feature from not being maintained.

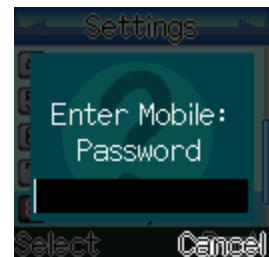

1. **Stand-by screen > Menu > Settings > Security > Change phone code**
 - Enter Mobile Password: Please enter the present mobile password.
 - New Password: Please enter the password that you want to change it into.
 - Verify Password: Please enter the new mobile password again.

Factory reset

When you select Factory reset, it will reset your WiFi phone to the factory related setting values. This modification needs to pass the mobile password confirmation first, and this password is the same with the one as **Stand-by screen > Menu > Settings > Security**.

1. **Stand-by screen > Menu > Setting > Factory reset**
2. Enter Mobile Password: Please enter mobile password to be verified.

If the mobile password has passed the confirmation, the WiFi phone will be reset to the factory related setting values, including each key and audio setting, WiFi AP setting and VOIP setting, **but the phonebook and call history will not be deleted.**

My phone info

You may view your WiFi phone info including Phone info., WLAN info. and Network info..

1. **Stand-by screen > Menu > Settings > My phone info.**
2. Press the navigation key  or  to browse the menu to
 - Phone info. and press  (left · Select) to view the phone number, firmware version and MAC address.
 - WLAN info. and press  (left · Select) to view the WiFi AP name SSID that the WiFi phone presently connects with.

- Network info. and press  (left · Select) to view the advanced settings of the WiFi network that the WiFi phone presently connects with. There are TCP / IP type, IP, Subnet Mask, default gateway, DNS1 and DNS2.

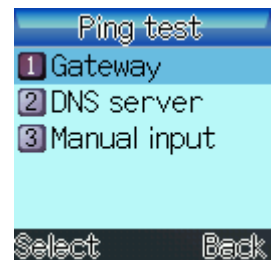

Admin menu

Admin menu provides Ping test, VoIP setting, Codec, Roaming and DTMF Mode administration.

Ping test

Ping test provides you to test if your WiFi phone connects well with the WiFi network. When your WiFi phone is not able to perform the call functions, you may use Ping test to confirm that if it's the problem of the connection between WiFi phone and the WiFi network causing call function exception.

1. Stand-by screen > Menu > Settings > Admin menu > Ping test
2. Press the navigation key  or  and select
 - Gateway: WiFi phone will automatically send signals to the presently connected Gateway.
 - DNS server: WiFi phone will automatically send signal to the presently connected DNS Server.
 - Manual input: WiFi phone will automatically send signals to an address that you manually input.
3. Press  (left · Select) and WiFi phone will send signals to the specified test location, and the test location will send signals back to WiFi phone when it receives the signals sent from the WiFi phone.
4. When it is sending the signals, please press  (left · Stop) so

WiFi phone will stop sending signals to the specified test location, and the test location will not send signals back to WiFi phone if it did not receive any signals from WiFi phone.

5. When the number of times WiFi phone sends signals is equal to the number of times the test location sends back signals, it indicates that Wifi phone connects well with

the test location. On the contrary, when the number of times WiFi phone sends signals is a lot more than the test location sending back signals, it indicates there is connection exception between WiFi phone and the test location.

VoIP Setting

You may save 4 groups of VoIP setting in the WiFi phone , VoIP setting is usually set by the telecom carrier when it factory. You may also add or modify you VoIP setting, please obtain the related setting value from your telecom carrier first when you try to add or modify the VoIP setting.

Add a new group of VoIP setting

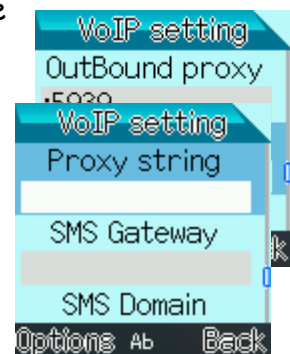

1. Stand-by screen > Menu > Settings > admin menu > VoIP setting

2. Press  or  and select a VoIP setting and input the following information:

- Display name: The name you set will be displayed on your stand-by screen.
- Phone number: Please input the phone number provided by the telecom carrier.
- User name: Please input the user name provided by the telecom carrier.
- Auth. password: Please input the authorized password provided by the telecom carrier.
- Domain: Please input the domain location provided by the telecom carrier. The domain location is usually combined by a string of values, there are "." between values to divide them from each other. **You have to input it correctly, or the WiFi phone may not be used normally.**
- 1st proxy: Please input the 1st proxy provided by the telecom carrier. The 1st proxy is probably the domain location plus COM port number, and there is ":" to divide the domain location and the COM port number. **When you input the domain location only, and it will take ":5060" as the default COM port number. You have to input correctly or you may not use the WiFi phone normally.**

- 2nd proxy: Please set this when necessary according to the telecom carrier's demands for the system.
- 1st registrar: Please input the register provided by the telecom carrier. The 1st register is probably the domain location plus the COM port number, and there is " : " to divide the domain location and the COM port number. **When you input the domain location value only, it will take " :5060 " as the default COM port number. You have to input correctly or you may not use the WiFi phone normally.**
- 2dn registrar: Please set this when necessary according to the telecom carrier's demands for the system.
- OutBound proxy: Please set this when necessary according to the telecom carrier's demands for the system.
- User agent: Please set this when necessary according to the telecom carrier's demands for the system.
- Proxy string: No need to set this item under normal circumstances.
- SMS Gateway: No need to set this item under normal circumstances.
- SMS Domain: No need to set this item under normal circumstances.
- VoIP name: Please input the setting name of this VoIP.

3. Press **⊖** (left · Options) and select " Save " to save this VoIP setting.

※ **When you finish the domain setting, if other settings such as OutBound proxy and user agent are the same with or close to the domain value, you may select it and press **⊖** (left · Options) and select " Same as domain ", then it will automatically fill in the selected column, you may modify it if necessary according to the fill-in value, so that it will save your time to input.**

※ Please refer to page 14 for the special symbols input method, but due to network provisions, there might be some special symbols that you cannot input.

Activate one set of VoIP Setting

When you have more than 1 set of VoIP setting, you may select the appropriate VoIP setting to use.

1. Stand-by screen > Menu > Settings > Admin menu > VoIP setting
2. Press the navigation key  or  to select one set of VoIP setting.
3. Press  (left · Options) and select " Activate " to activate this VoIP setting.

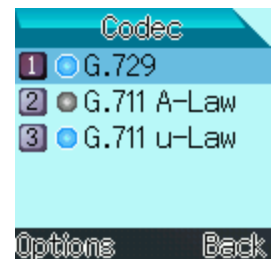

Codec

Your WiFi phone supports different sound codec standard, including G.729, G.711 A-Law and G.711 μ -Law. For your WiFi phone can be used normally, you have to at least enable one set of the codec standard, of course you may also enable several sets of codec standard.

To enable and disable a set of codec

1. Stand-by screen > Menu > Settings > Admin Menu > Codec
2. Press the navigation key  or  and select a codec standard.
3. Press  (left · Options) and select
 - Codec enable: to enable this codec standard.
 - Codec disable: to disable this codec standard.

To change the priority of the codec

You may change the priority of the codec standard to enable.

1. Stand-by screen > Menu > Settings > Admin menu > Codec
2. Press the navigation key  or  and select a codec standard.
3. Press  (left · Options) and select
 - Up: to move up the order to enable the codec standard.
 - Down: to move down the order to enable this codec standard.

Roaming

Your WiFi phone provides the roaming function.

When the WiFi phone is at more than one WiFi network area, and the WiFi AP is already on your AP setting list, then this WiFi AP setting is already saved in your phone. So when you start the roaming function, the WiFi phone will automatically switch to the higher- signal intensity WiFi AP.

Your WiFi phone supports Layer 2 roaming, so even when you are at other WiFi network area, it will not change the phone IP. If you need the phone to support Layer 3 roaming, then you will have to send the DHCP demand again while roaming to other WiFi network area and renew your IP address. Please contact your telecom carrier to modify the setting value.

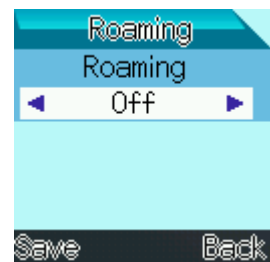

To open or close roaming

1. Stand-by screen > Menu > Settings > Admin menu > Roaming

2. Press the navigation key  or  to switch the roaming function.

- On: to open the WiFi phone roaming function.
- Off: to close the WiFi phone roaming function.

3. Press  (left > Save) to save this roaming function setting.

※ For the WiFi phone to successfully complete roaming, the recommendations to build the WiFi network are as the following:

A · You have to set a different name for the WiFi AP name SSID, if you need to use the same SSID, please contact the telecom carrier to modify the setting value.

B · It needs to connect the internet through LAN Port for all the WiFi AP waiting for roaming, they are all set as 「Close DHCP」. The WiFi phone IP can be set as " Static IP "or " DHCP ", provided by the back-end server. When you change from WiFi AP A to WiFi AP B, the phone IP will not be changed.

DTMF Mode

Your WiFi phone supports different DTMF mode, including RFC2833, SIP Info and In-band. Please contact your telecom carrier to confirm the related setting value before you set this. It is usually preset as RFC2833.

To enable a set of DTMF Mode

1. Stand-by screen > Menu > Settings > Admin menu > DTMF Mode
2. Press the navigation key  or  and select a DTMF Mode.
3. Press  (left · Set) and DTMF Mode will be enabled.
